TAKE CONTROL OF YOUR
CLASSII
Let’s face it. There are a lot of variables when performing a Class II restoration. Why not choose products from a proven leader in dentistry? It’s the control, predictability, speed and reliability required for successful outcomes.

See the benefits in action. Visit www.Class2Restorations.com to view how our portfolio of Class II products fit into your procedure.
Combine Forces for Complete Control.

Every one of DENTSPLY Caulk’s Class II restorative products is designed by dentists for dentists to give you the perfect instrument for predictable results. Use them together and you’ll discover the only complete Class II restorative solution available that puts complete control of every Class II step in your hands.
The Shape of Confidence
The start to a beautiful Class II is giving you a tighter, anatomical fit. With the Palodent® Plus Sectional Matrix System, you’ll find confidence in close, accurate contact creation. Through a nickel-titanium band that stays true to form to wedges and guards tailored for precision, we’ve developed a system for contacts you can depend on – every time.

Never Compromise
Your art is all in your technique. So there’s no reason to ever have to compromise during a Class II restoration. Prime&Bond Elect® is a reliable universal adhesive that offers consistent high-bond strengths with extremely low film thickness. From selective to self to total-etch, you’re in control of your Class II with virtually no post-op sensitivity.

Self-Level the Playing Field
When you have the only self-leveling, bulk fill flowable, you can save up to 40% in Class II placement time. SureFil® SDR® flow is a one-of-a-kind product that combines self-adapting properties and category best shrinkage stress at depths of up to 4mm. With over 18 million applications, it’s no wonder 85% of dentists enjoy simplified Class II’s.
Handling is Personal

One composite does not fit all. TPH Spectra® Universal Composite is the only composite with preferred handling, available in both low and high viscosity formulas. Whether you like to sculpt or spread, you'll discover the first composite that caters to your procedural style. Add simplified shading, and it's nothing but first class, Class II restorations.

Only One Way to Finish

Why struggle with four components when you can finish with one? Use the Enhance® Finishing System after finishing with a bur and effectively smooth restoration surfaces prior to polishing for a final result with a high luster.¹

For more details visit www.Class2Restorations.com, or contact your DENTSPLY Caulk representative today.
Visit Class2Restorations.com or contact your DENTSPLY Caulk representative today.
Still undisputed. Still revolutionary.

SureFil® SDR® flow is a one-of-a-kind breakthrough in dentistry. It’s the only bulk fill flowable that combines exclusive self-leveling properties and category best shrinkage stress at depths up to 4mm.

The only self-leveling & self-adapting flowable.

The key is its SDR™ technology, which reduces polymerization stress by up to 60%. This allows for an amazing 4mm bulk fill and excellent cavity adaptation without manipulation. With over 20 million applications sold and over 27,000 registered users – it’s an industry game changer.

The science behind the breakthrough.

With SDR™ technology, you’ll experience less shrinkage and significantly lower stress. It optimizes the way the polymer network is formed while curing – reducing the polymerization stress caused by polymers that become too taut.

85% of dentists enjoy simplified Class I & II restorations.

Streamline Class I & II restorations and save up to 40% in placement time.

- Exclusive self-leveling handling
- Easy placement & no manipulation
- Excellent cavity adaptation
- Quickly dispense & cure with Compula® Tips
- Radiopaque for easy visualization on x-rays

Discover a Finer Finish.

At DENTSPYL Caulk, our restorative solutions shine for dentists. With the Enhance® Finishing System, you’ll find an easy, dependable and controllable method for achieving natural looking, high-gloss restorations.

Bring Luster to Life.

Surface roughness testing and SEM photos show that the composite surface is smoother when Enhance® Finishers are used after gross contouring with a bur. As pressure is applied, abrasive particles disengage from the Enhance® cup, disc, or point to effectively buff the surface of the restoration. The result is a smooth, contoured surface that is pre-polished and thus more resistant to plaque retention and staining.1

An Easy Way to Shine.

One Component: Enhance® with one component instead of four. Control: More pressure for an aggressive initial finish; less pressure to smooth the surface.

Tailored for your technique.
Prime&Bond Elect® Adhesive is a reliable, convenient, universal adhesive for any bonding technique. Whether it’s total-etch, self-etch or selective-etch, you’ll discover consistent, high bond strengths necessary to meet the clinical needs of your patients. All with virtually no post-operative sensitivity.

Low film thickness. High bond strength.
The film thickness of the adhesive layer is critical to ensure adequate penetration into the dentin tubules and to minimize pooling in the floor of the prep. Prime&Bond Elect® Adhesive provides a lower film thickness which may reduce the likelihood of false indications of recurrent decay on radiographs.

Built upon 12 years of clinical success with the Prime&Bond® NT™ Adhesive brand. PENTA (dipentaerythritol penta acrylate monophosphate) technology used in Prime&Bond Elect® Adhesive provides a chemical bond to the tooth in addition to the micro-mechanical bond achieved.

Want to learn more?
Visit www.PrimeandBondElect.com or contact your authorized DENTSPLY distributor today.

SELECTIVE-ETCH
Use with Caulk® 34% Tooth Conditioner Gel and get better application control at the enamel-dentin junction. Plus, get dentin high bond strength, a tight seal at the enamel margin and minimal etchant exposure.

SELF-ETCH
Create a high-bond strength with virtually no sensitivity.

TOTAL-ETCH
Creates a strong bond on enamel and dentin. Total-etch is ideal in clinical situations where there’s a large amount of enamel, such as veneer placement.
Experience Prime&Bond Elect® Adhesive for yourself. Contact your DENTSPLY Caulk representative for a free sample or to place your order, today.

Preferred Handling. Simplified Shading.

One composite doesn’t fit all. That’s why TPH Spectra® Universal Composite is the only composite with preferred handling. Available in both high and low viscosities, you’ll discover the first composite that caters to your procedural style. Whether you like to pack and sculpt or spread and flow, most dentists prefer the handling of TPH Spectra® Composite.

2 Out of 3 Dentists Prefer TPH Spectra® Composite when compared to their current composite.†

Stain Resistant.

We went head-to-head with Filtek™ Supreme Ultra, Kalore™ and Venus® Diamond to compare which composite stains less. The results speak for themselves. Both TPH Spectra® Composite LV and HV had the best stain resistance out of the other leading competitors. *

Less Staining.

Your patients appreciate your artistry when it comes to restorations. So why not use a composite that resists stains better than the competition? Keep your restorations looking pristine even after your patients leave the chair with TPH Spectra®.

21 Years & 145 Million Applications.

The TPH® brand has been a staple of dentists’ armamentarium for over two decades. This industry-defining composite material has a long history of clinically-proven results that have seen hundreds-of-millions of restoration applications. All backed by the innovation and dental industry expertise of DENTSPLY Caulk.

Simplified Shading.

Seven of the most essential shades now cover the entire VITA® shade range making TPH Spectra® one of the easiest to use. This simplified shading palette offers dentists a quicker shade selection process. Together with our proprietary blend of resin and fillers, you’ll enjoy a chameleon effect that defies detection for a lifelike restoration.

* Cured composite specimens were prepared by curing the composite in a stainless steel mold, 1 mm thick x 15 mm in diameter, with 1/16 in. curing light for 12 minutes each side at room temperature. The cured specimens were post-treated at 37°C in DI water for at least 24 hours. The treated specimens were soaked in 30 mL red wine (Cashmere by Cline Cellars) at room temperature for 24 hours. The color values (CIE L, a, b values) of each color chip was determined by Xrite Color Eye before and after the red wine staining. Minimum 2 specimens were prepared and tested for each material. The average value and standard deviation were recorded.

†The color difference after the red wine staining is calculated as 

dE = \sqrt{(L^* - L_{ref})^2 + (a^* - a_{ref})^2 + (b^* - b_{ref})^2} 

† Based on blind testing.

Tight, accurate contacts.

Get it right the first time, every time. The Palodent® Plus Sectional Matrix system is designed to help you take a strong first step toward desirable Class II outcomes. The ring maintains a fit on the tooth that complements the anatomical design of the matrix and wedge, working together to seal and shape the restoration for a tight contact with minimized flash.

Predictable outcomes.

Restoring proper interproximal contact and contour is critical to Class II success. Insufficient recreation of interproximal anatomy has been shown to lead to food traps, fractures, and redos — ultimately putting your Class II outcomes in jeopardy. Welcome predictability to your Class II contacts and contours with the Palodent® Plus Sectional Matrix system. The Palodent® Plus matrices are shaped to commonly encountered cavity form, have a built in contact embrasure for accurate interproximal anatomy, and a bendable tab for easy matrix placement. Significantly greater horizontal curvature allows the matrix to hug the tooth, while a gingival apron provides coverage on deeper preps. Opt for the Palodent® Plus EZ Coat matrices and enjoy easy matrix removal thanks to a micro-thin nonstick finish.

Wide applications for sectional matrix system use.

The ring tines engage the gingival zone of significantly damaged teeth and prevent the matrix from collapsing into wide preps, even when a cusp is missing. The rings can be stacked for multiple restorations simultaneously, and the innovative v-shaped tines eliminate competition between the ring and wedge in the interproximal space. You can even insert a second wedge from the opposite side with the ring already in place.

Industry-leading technology, optimized for ease of use and performance.

Every component is designed for consistent results and high performance. The system includes:

- Universal Rings
- Narrow Rings
- Wedges & WedgeGuards
- Palodent® Plus EZ Coat non-stick matrices
- Pin Tweezers & Forceps
